Background:

Splenic artery aneurysm and pseudoaneurysm are rare pathologies. We report a case of a splenic artery aneurysm in which the patient presented with recurrent episodes of upper gastrointestinal bleeding.

Methods:

A 69-year-old male patient with history of pancreatic head cancer s/p whipple procedure, diabetes mellitus and hepatitis C, He had presented with episodes of hematemesis and tarry stool.

Results:

Upper GI endoscopy showed a mass lesion in stomach with ulcer on surface and pulsative vessel were noted. Abdominal CT revealed a splenic artery aneurysm. TAE was done for the aneurysm. The patient was under NPO status with PPI and IVF supplement. The patient was discharged after symptom gradually improved.

Conclusion:

Splenic artery aneurysms can result in recurrent upper gastrointestinal bleeding.
